^{9}Be	159.3 ° ± 5.9°	71.77 ± 0.80

- significant back-to-back correlation → this feature rules out completely the first event on ^{7}Li
- the correlation between $\cos\vartheta(\pi^- p)$ and E_p was studied for the simulated background: major contribution from this source when π and p are emitted nearly back-to-back and $E_p \geq 100$ MeV
- evaluation of the number of simulated events surviving to a 3σ cut on $\cos\vartheta(\pi^- p)$ and E_p on ^{7}Li and ^{9}Be: $\sim 10^{-3}$ events were found for both targets

the 2 $\Lambda np \rightarrow nnp$ real events DO NOT belong to background to a confidence level ≥ 99%.

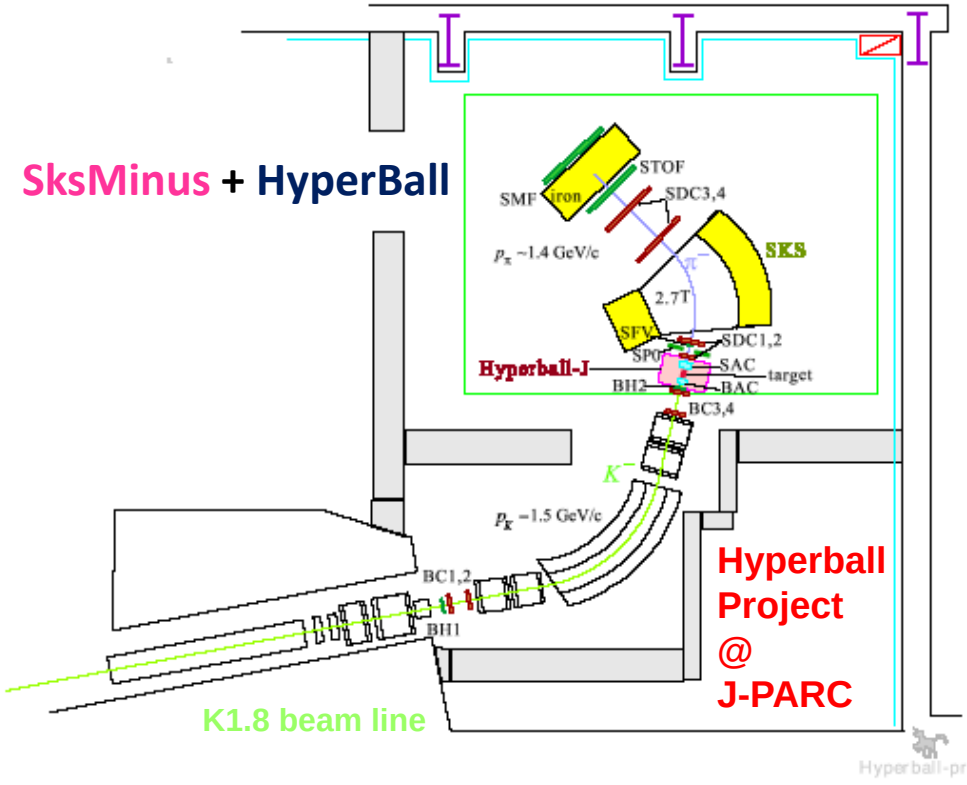
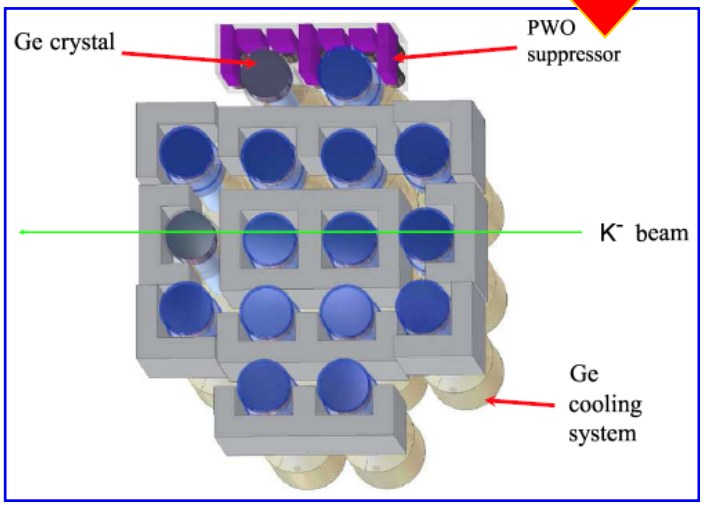
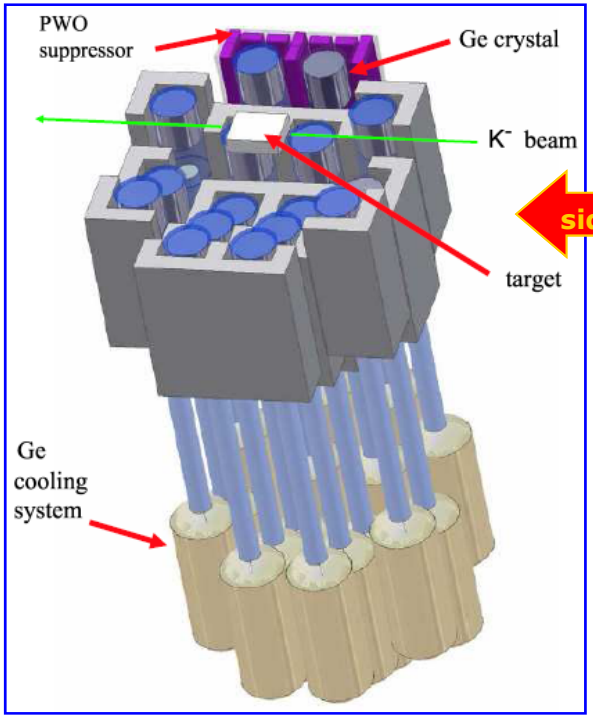
E13 experiment layout

γ-ray spectroscopy of hypernuclei

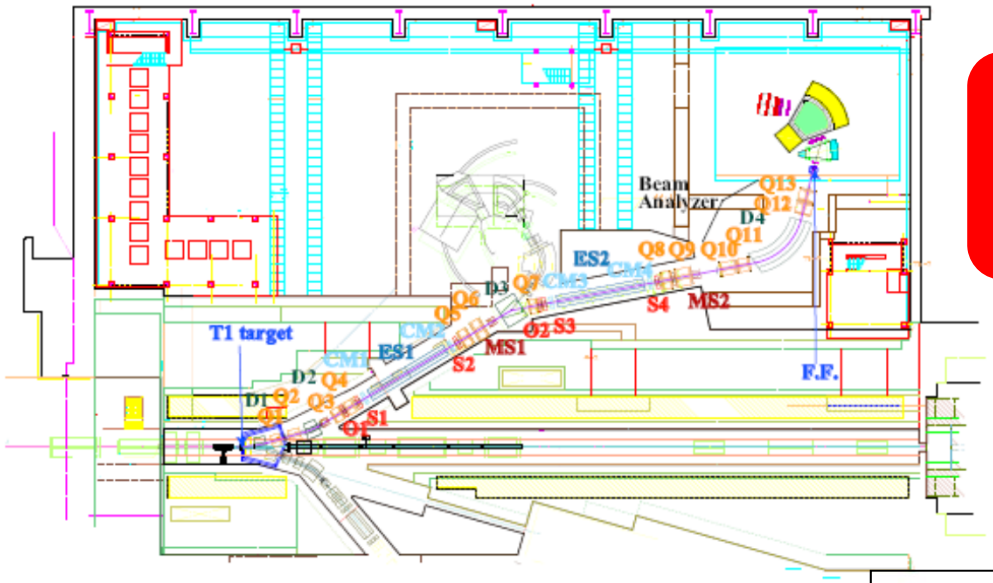
- further study of ΛN interaction: $^{4}_{\Lambda}$He, $^{10}_{\Lambda}$B, $^{11}_{\Lambda}$B, $^{19}_{\Lambda}$F
  - ΛN-ΣN coupling and 3-body force
  - charge symmetry breaking (Λn ≠ Λp?)
  - radial dependence (interaction range)
- g_{Λ} in a nucleus from spin-flip B(M1): $^{7}_{\Lambda}$Li





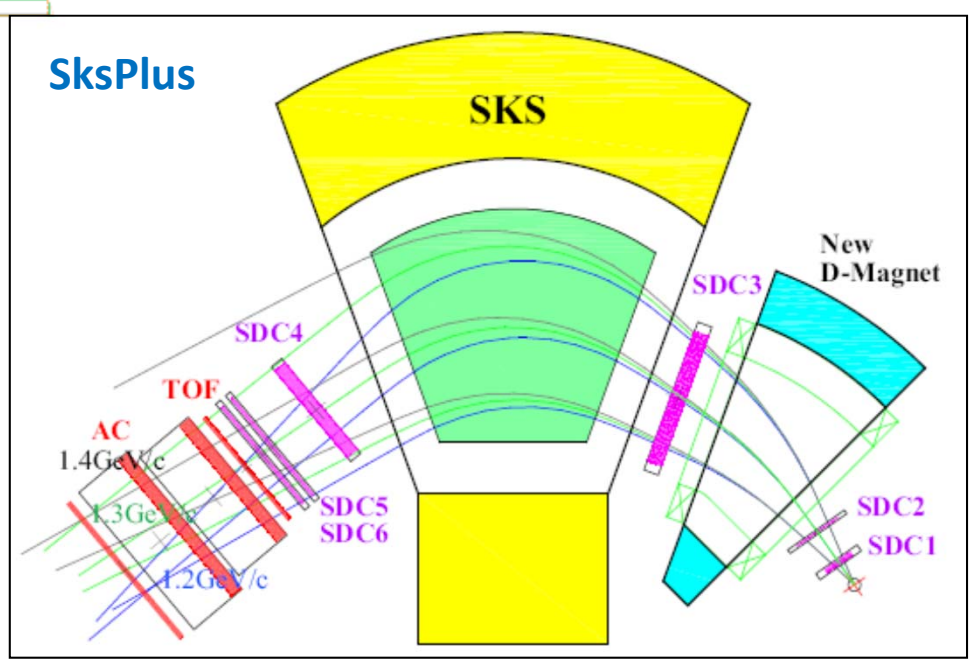


E05 experiment layout



Spectroscopic study of Ξ-hypernucleus, $^{12}Be_{\Xi}$, via the $^{12}C(K^-,K^+)$ reaction

- first spectroscopic study of S = -2 systems in (K^-,K^+) reaction
- ΞN interaction
  - ? attractive or repulsive
  - ? depth of Ξ-nuclear potential
  - ? isospin dependence
  - ? ΞN-ΛΛ *coupling force*



Summary

- Last but not least results from FINUDA:
  - first experimental evidence for the heavy hyperhydrogen $^{6}H_{\Lambda}$
  - first direct observation of $2\,\mathcal{N}$ induced hypernucleus weak decay

- FINUDA could be considered an ideal bridge between the KEK and the J-PARC eras:

we are now looking forward for new and exciting world class results

Thank you!
