Dear reader,

the book 'The Standard Model in the Making' is made of 685 pages and our aim has been to present all the details needed to derive the results and to collect in one place all relevant formulas, recipes and prescriptions that are needed to construct loop corrections and improvements in quantum field theory.

The book has been typeset by us using LaTeX during a period of approximately two years. We have tried to be as careful as possible, even more than that, but it is an obvious fact of life that one cannot avoid typos. There are several reasons for that, sometimes one of the authors will introduce a new *Macro* with awkward and unexpected propagation of typos, while in several other occasions it is pure psychology.

We do not claim that there is any excuse for having typos in our book, we will take our little scientific credit, developed during many years of work, and consume it in a measure proportional to the number of awkward things found in the book. Of course, we are going to do more than that, we are going to take care of an *on-line* correction of the typos that we find. This Web page is, therefore, devoted to the *Errata Corrige* of our book. Please, consult it, we are keeping it updated!
