Beyond Three-Neutrino Mixing: Sterile Neutrinos

Terminology: a eV-scale sterile neutrino
means: a eV-scale massive neutrino which is mainly sterile

Sterile Neutrinos from Physics Beyond the SM

- ▶ Neutrinos are special in the Standard Model: the only **neutral fermions**
- ▶ **Active left-handed neutrinos** can mix with non-SM singlet fermions often called **right-handed neutrinos** **Neutrino Portal** [A. Smirnov, arXiv:1502.04530]
- ▶ Light anti- ν_R are **light sterile neutrinos**

$$\nu_R^c \rightarrow \nu_{sL} \quad (\text{left-handed})$$

- ▶ Sterile means **no standard model interactions**
[Pontecorvo, Sov. Phys. JETP 26 (1968) 984]
- ▶ Active neutrinos (ν_e, ν_μ, ν_τ) can oscillate into light sterile neutrinos (ν_s)
- ▶ Observables:
 - ▶ **Disappearance** of active neutrinos (**neutral current deficit**)
 - ▶ Indirect evidence through **combined fit of data** (**current indication**)
- ▶ Short-baseline anomalies + 3ν -mixing:

$$\Delta m_{21}^2 \ll |\Delta m_{31}^2| \ll |\Delta m_{41}^2| \leq \dots$$

ν_1	ν_2	ν_3	ν_4	...
ν_e	ν_μ	ν_τ	ν_{s1}	...

- ▶ In this talk I consider sterile neutrinos with mass scale $\sim 1 \text{ eV}$ in light of short-baseline Reactor Anomaly, Gallium Anomaly, LSND.
- ▶ Other possibilities (not incompatible):
 - ▶ **Very light sterile neutrinos** with mass scale $\ll 1 \text{ eV}$: important for solar neutrino phenomenology

[de Holanda, Smirnov, PRD 69 (2004) 113002; PRD 83 (2011) 113011]

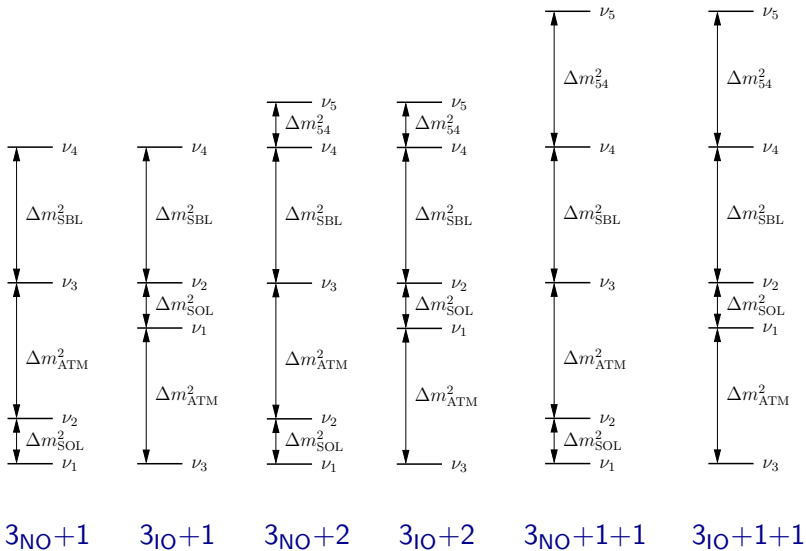

[Das, Pulido, Picariello, PRD 79 (2009) 073010]

Recent Daya Bay constraints for $10^{-3} \lesssim \Delta m^2 \lesssim 10^{-1} \text{ eV}^2$ [PRL 113 (2014) 141802]

- ▶ **Heavy sterile neutrinos** with mass scale $\gg 1 \text{ eV}$: could be Warm Dark Matter

[Asaka, Blanchet, Shaposhnikov, PLB 631 (2005) 151; Asaka, Shaposhnikov, PLB 620 (2005) 17; Asaka, Shaposhnikov, Kusenko, PLB 638 (2006) 401; Asaka, Laine, Shaposhnikov, JHEP 0606 (2006) 053, JHEP 0701 (2007) 091]

- ▶ neutrinos in equilibrium in early Universe through weak interactions:

- ▶ weak interactions freeze out \implies active $(\nu_e, \nu_\mu, \nu_\tau)$ neutrino decoupling

$$\Gamma_{\text{weak}} = N\sigma v \sim G_F^2 T^5 \sim T^2/M_P \sim \sqrt{G_N T^4} \sim \sqrt{G_N \rho} \sim H$$
$$T_{\nu\text{-dec}} \sim 1 \text{ MeV} \qquad t_{\nu\text{-dec}} \sim 1 \text{ s}$$

- ▶ sterile neutrinos can be produced by $\nu_{e,\mu,\tau} \rightarrow \nu_s$ oscillations before active neutrino decoupling ($t_{\nu\text{-dec}} \sim 1 \text{ s}$)
- ▶ energy density of radiation before matter-radiation equality:

$$\rho_R = \left[1 + \frac{7}{8} \left(\frac{4}{11} \right)^{4/3} N_{\text{eff}} \right] \rho_\gamma \qquad (t < t_{\text{eq}} \sim 6 \times 10^4 \text{ y})$$

$$N_{\text{eff}}^{\text{SM}} = 3.046 \qquad \Delta N_{\text{eff}} = N_{\text{eff}} - N_{\text{eff}}^{\text{SM}}$$

- ▶ sterile neutrino contribution: $\rho_s = (T_s/T_\nu)^4 \rho_\nu \implies \Delta N_{\text{eff}} = (T_s/T_\nu)^4$

- ν_s with $m_s \simeq \sqrt{\Delta m_{41}^2} \sim 1 \text{ eV}$ become non-relativistic at $T_\nu \sim m_s/3$
 ($t_{\nu_s\text{-nr}} \sim 2.0 \times 10^5 \text{ y}$, before recombination at $t_{\text{rec}} \sim 3.8 \times 10^5 \text{ y}$)

Tension between $\Delta N_{\text{eff}} = 1$ and $m_s \approx 1 \text{ eV}$

Sterile neutrinos are thermalized ($\Delta N_{\text{eff}} = 1$) by active-sterile oscillations before neutrino decoupling

Conclusions

- ▶ Short-Baseline ν_e and $\bar{\nu}_e$ Disappearance:
 - ▶ Experimental data agree on Reactor $\bar{\nu}_e$ and Gallium ν_e anomalies.
 - ▶ Problem: unknown systematic uncertainties (Reactor $\bar{\nu}_e$ flux).
 - ▶ Many promising projects to test unambiguously short-baseline ν_e and $\bar{\nu}_e$ disappearance in a few years with reactors and radioactive sources.
 - ▶ Independent tests through effect of m_4 in β -decay and $\beta\beta_{0\nu}$ -decay.
- ▶ Short-Baseline $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ LSND Signal:
 - ▶ Not seen by other SBL $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$ experiments.
 - ▶ MiniBooNE experiment has been inconclusive.
 - ▶ Experiments with near detector are needed to check LSND signal!
 - ▶ If $|U_{e4}| > 0$ why not $|U_{\mu 4}| > 0$? $\implies \sin^2 2\vartheta_{e\mu} = 4|U_{e4}|^2|U_{\mu 4}|^2 > 0$
- ▶ Pragmatic 3+1 Fit is fine: moderate APP-DIS tension.
- ▶ 3+2 is not needed: same APP-DIS tension as 3+1 and no evidence of CP violation.
- ▶ Cosmology:
 - ▶ Tension between $\Delta N_{\text{eff}} = 1$ and $m_s \approx 1$ eV.
 - ▶ Cosmological and oscillation data may be reconciled by a non-standard cosmological mechanism.
